How to auto-deploy a print queue to specific PDAgents

If you would like to individually specify which PDAgents should get a print queue installed, as opposed to specifying a range, follow these steps:

- Open Resource Manager.
- Navigate to **Print Management** > **Print Queue Management** > **Queue Deployments.**
- Double click the Queue Deployment on the right. If it doesn't exist create one manually, or copy from an existing print queue.
- In the **Deployment Scope** frame set the **Auto deploy** dropdown to **Selected deployment zones**.
- Click the **Deployment zones** tab.
- Click **Add.**
- In the **New deployment zone** window, enter a descriptive name for the zone.
- Set the **Include or exclude drop-down** to **Only include those matching search parameters**.
- On the **Hosts** tab, set the **Match hosts** drop-down to **Specific PDAgents**.
- In the list of PDAgents, tick the individual PDAgents that will have this queue auto installed.
- Click **OK** and **OK** again.

If you would like the deployment to happen immediately, refresh the individual PDAgents or right click the PDServer and choose **Send Command** > **Refresh all connected PDServers**.
