

How to link a print queue to a Queue Deployment

Having print queues linked to a Queue Deployment allows them to be centrally managed. If the driver is changed in the Queue Deployment, the drivers of any linked print queues will be automatically changed. Similarly, [updating a Queue Deployment with new printing preferences](#) will cause all linked print queues to be updated with the same printing preferences.

Installed print queues are linked to Queue Deployments in the following ways:

1. When a print queue is installed from a Queue Deployment.
2. When a new Queue Deployment is [created from an existing queue](#).
3. When a Queue Deployment is installed on a computer that has a print queue with the same name as the Queue Deployment.
